Set up in 10 minutes

No tools. Do this in daylight, before the first night.

THE BACK OF THE UNIT, LEFT TO RIGHT

One rule: the tube with the black wire is the cup tube. It uses the sensor socket and IN. The plain tube uses OUT and ends in the jug.

1. **Charge it by day.** Plug the charger into the charging socket (lift the rubber cap). Unplug it before the night.
2. **Cup tube.** Screw the white sensor tip onto the threaded connector at the base of the cup. Push the other end onto **IN**. Push the wire's silver plug fully into the **sensor socket**.
3. **Jug tube.** Push one end onto **OUT**. Put the other end through the hole in the jug's cap.
4. **Switch on.** Flick the power switch on the front. A red light means it is on. Press the manual-drain button once to check the pump runs.
5. **Test it.** Pour a little tap water into the cup (not purified water). The pump starts by itself, the green ring lights, then it stops.
6. **Fit the cup.** Snap the cup to the four studs inside the brief, then fit the brief and adjust the straps until it feels held, never tight.
